

The Way Things Are: All Matter resolving to Dark Energy

This work posits that the natural environment is Active, and that life forms orientate to its inherent Dark Energy/Polarity. In order to understand much natural phenomena, weather, climate change, natural cycles and more, it is necessary to recognize that the environment is Active and resolves to Dark Energy. Dark energy is in the form of dual, longitudinally travelling, contra-directional, integrated, fieldstreams. Although these contain immense energy, measurement of it cannot be made because the fieldstreams are contra-directional, therefore their energies cancel in the sensor of an instrument. That is why it is dark.

Dark energy can be described only within a STEADY STATE concept of physics because this only can describe its existence. To describe it within a Singularity concept (Big Bang) is futile. This work is a synopsis of a Steady State concept of physics, wherein natural functions/processes are correlated to a concept named Accrual/Relinquish of mass. This results from modulations in the Dark Energy field medium, in turn inherited from orbital characteristics of systems downstream of the solar system in the dark energy chain, and from which the solar system accretes. Life forms only, having evolved dual biology, can detect/utilize dark energy/polarity, making our existence possible. Environmental energy cycles are augmented only, by solar radiation and exacerbated only, by human activities. Vortice Physics is a galaxy centric description of Dark Energy in the form of inherent energy within dual, contra-directional, integrated, longitudinally travelling fieldstreams, orientated into vortices on an infinite scale. Input fieldstreams of each vortice accrete at its peripheral regions, exponentially concentrate to a focal region, where a body comprising field-vortices at lesser magnitude, manifest/corralled by a

fieldstream cradle. Output fieldstreams of manifested field-vortices are of opposite polarity (direction) to that of input fieldstreams and this accounts for its duality. Input fieldstreams to the body are named Primary. Output fieldstreams from the body are named Secondary. Bodies are globular shaped, forged by its fieldstream cradle. Body/cradle are interdependent and form a unit named a Mass-field Vortice System. Each accretes fieldstream energy at its peripheral regions, from the ether of an immediate downstream system in the chain, which become its primary fieldstreams. Its secondary fieldstreams form an ether of its own system from which satellites, if any, accrete. In the case of the solar system, fieldstreams accrete from the ether of a 2 m-yr downstream system; acquire its duality from integrated output fieldstreams from the planets, and exponentially concentrate to a focal region, where they manifest/cradle the sun. The pattern is essentially the same throughout the galaxy, the energy exponentially concentrating to a focal region via two main arms, thence radiated into an inter-galactic ether, all in accordance with 2nd law of thermodynamics.
